WEEKLY BUSINESS REVIEW

Olist Brazilian E-Commerce Marketplace

Historical dataset review | Revenue, retention, demand, and delivery experience

Executive summary

The observed dataset contains **R$13.22 million in delivered product revenue** across 24 calendar months. Delivery performance is a notable customer-experience concern: late-delivered orders averaged **2.57/5** in review scores, compared with **4.29/5** for early deliveries. This 1.72-point difference supports further investigation of fulfilment delays.

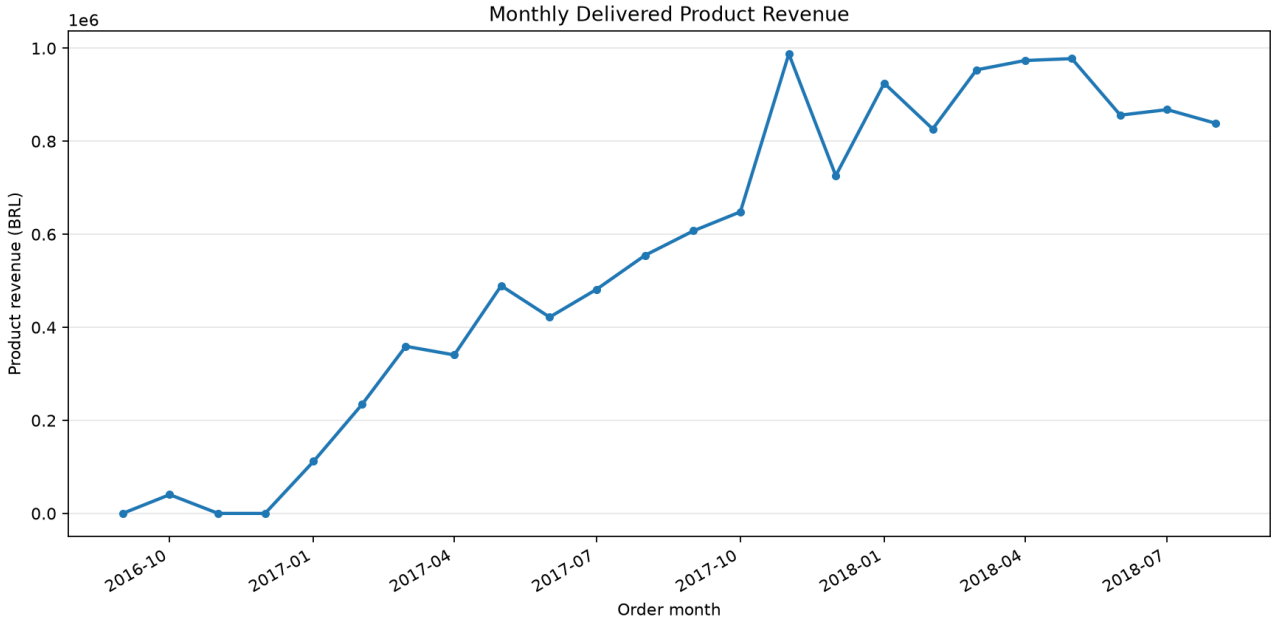

R$13.22M Delivered product revenue	3.12% Repeat-purchase rate
8.11% Late-delivery rate	2.57 / 5 Late-order review score

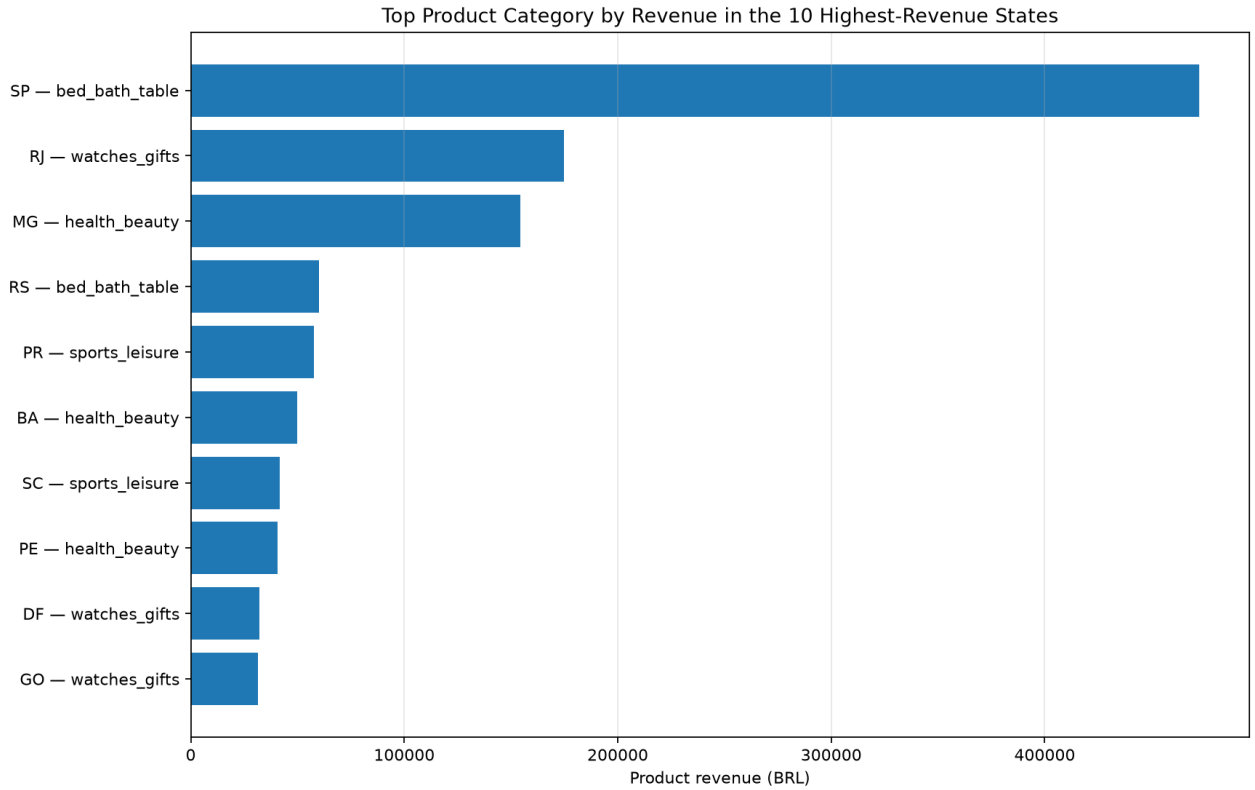

North Star and supporting metrics

Metric	Definition / interpretation
North Star: delivered product revenue	Sum of item prices for delivered orders; freight excluded.
Order demand	Daily order count and seven-calendar-day rolling average.
Repeat-purchase rate	Unique customers with at least two distinct orders ÷ all unique customers.
Late-delivery rate	Late delivered orders ÷ delivered orders with a valid delivery delay.
Customer satisfaction	Average review score by delivery-performance group.

Commercial performance

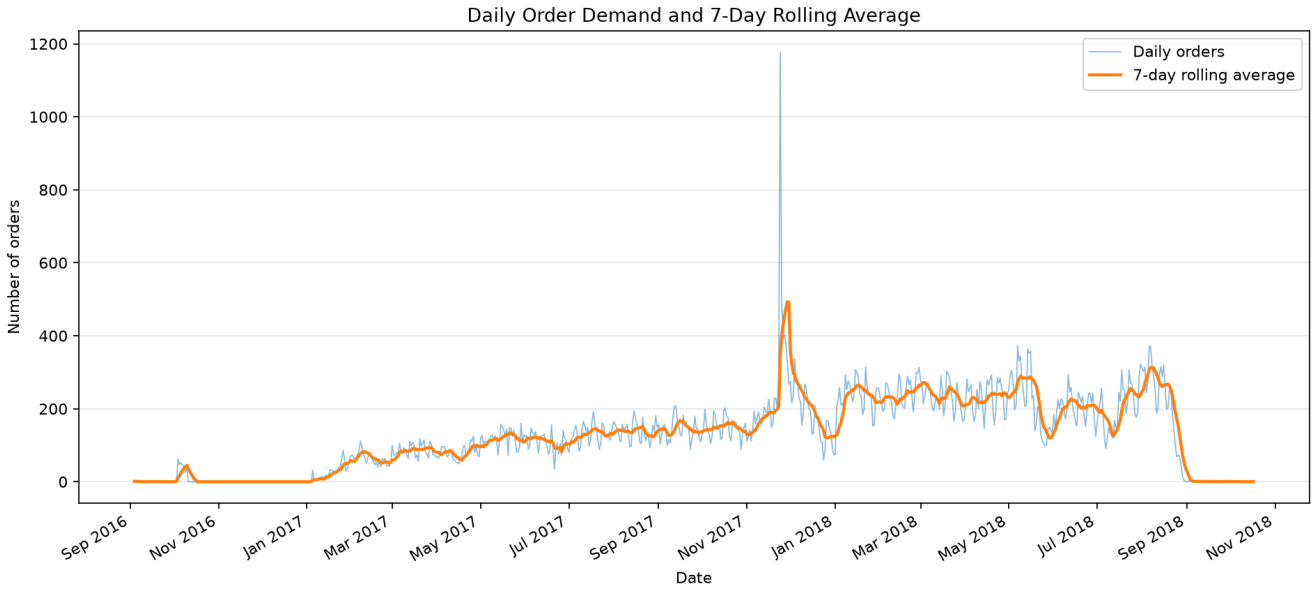

Delivered product revenue is the primary outcome metric. The category chart highlights the leading product category in each of the ten highest-revenue customer states.

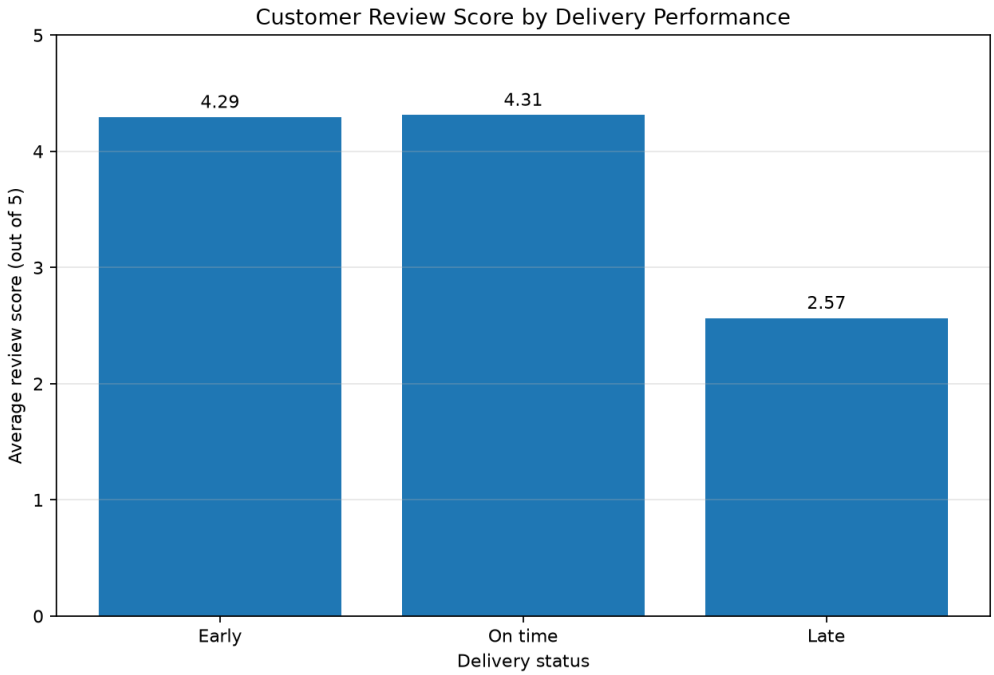

Demand and customer experience

The rolling average smooths day-to-day demand fluctuations. The delivery comparison indicates a strong association between lateness and lower review scores; it does not establish causation.

VP memo: decisions and next actions

Key finding

Late-delivered orders averaged **2.57/5**, compared with **4.29/5** for early deliveries. The late-delivery rate was **8.11%** among 96,470 delivered orders with valid delay data.

Recommended actions

1. Investigate delivery drivers. Segment delays by seller, customer state, product category, and estimated lead time.

2. Prioritize at-risk shipments. Test proactive monitoring and escalation for orders approaching their estimated delivery date.

3. Improve repeat purchasing. Investigate barriers to repeat orders and test post-purchase retention initiatives.

4. Review trade-offs monthly. Track delivered product revenue alongside late-delivery rate and customer review score.

Methodology and limitations

Revenue is the sum of item prices for delivered orders, excluding freight. Repeat purchase uses customer_unique_id and counts distinct orders; the observed rate is 3.12%. Delivery analysis excludes delivered orders without a calculable delay. The source dataset is historical and may not represent current performance. The relationship between delivery timing and review score is observational.

Data quality: 789 duplicated review-ID groups and two payment records with zero installments were retained as documented warnings; these records were not silently removed or altered. Product weights missing in two rows remain NULL.

Decision requested: prioritize a targeted delivery-performance investigation and report back with seller/state-level drivers and a measurable improvement plan.
